Abstract

Naps are beneficial for learning in typically developing infants, children, and adults. They show greater retention when a delay between training and test contains sleep then when it is a comparable period of wake. However, individuals with Down syndrome have a high rate of disordered sleep than seen in the typical population. Do they experience the same benefits of sleep on learning?

Keywords: naps, sleep, memory, development, Down syndrome

Groups	N	Mean_age	PercentFemale
DS	25	9.49	52
TD	24	5.03	54

Materials & Procedure

The goal of this study was to assess the retention of new words with various intervals between training and test. Children received all conditions 1-2 weeks apart. The conditions included: 1. after a 5 min delay 2. after a nap (4 hour delay) 3. after 24 hours

Data analysis

The authors assessed the number of trials needed to reach criterion across conditions and groups.

The first analysis conducted was a repeated measures ANOVA for both wake and nap conditions. The second was a 2x2 ANOVA with delay type as the repeated factor and TD or DS as the between. These were conducted for the 4 and 24 hour delay.

The second was a 2x2 ANOVA with delay type as the repeated factor and TD or DS as the between. These were conducted for the 4 and 24 hour delay.

We used R (Version 3.5.2; R Core Team, 2018) and the R-packages *data.table* (Version 1.12.0; Dowle & Srinivasan, 2019), *dplyr* (Version 0.8.0.1; Wickham, François, Henry, & Müller, 2019), *ggplot2* (Version 3.1.0; Wickham, 2016), *papaja* (Version 0.1.0.9842; Aust &

Barth, 2018), *readxl* (Version 1.3.1; Wickham & Bryan, 2019), and *xtable* (Version 1.8.3; Dahl, Scott, Roosen, Magnusson, & Swinton, 2018) for all our analyses.

Results

Grouping	Timing	meanNTC	SEMNTC
DS	Immediate	1.680000	0.2628054
DS	Sleep	1.640000	0.1620699
DS	Wake	2.080000	0.1993322
TD	Immediate	2.041667	0.2789679
TD	Sleep	1.708333	0.1408973
TD	Wake	1.666667	0.2055980
